```

6. Potential Misconfiguration

1-SMB Anonymous Access

Nmap smb enumeration shows that anonymous access was available on some SMB shares (tmp read/write) , (IPC\$ read/write)

7. Relevant CVEs

-CVE-2017-7494

The target was identified as running Samba 4.6.2. This version falls within the affected range for CVE-2017-7494, which can allow remote code execution when a writable SMB share is available. The vulnerability should be validated against the target's SMB share configuration.

8. Recommendations

- Disable anonymous/guest access where it is not required.
- Remove unnecessary write permissions from publicly accessible shares.
- Restrict SMB ports 139 and 445 to trusted networks.
- Upgrade the outdated Samba installation to a supported version.
- Review SMB shares and permissions regularly.
- Disable unused shares and services.
